

Locking Up the BMC CONTROL-M Back Door

In this session, you will learn how your BMC CONTROL-M environment can become an even more secure environment. The session will focus on generating server-specific certificates, and how this type of certificate will allow communication from the server to the agents that are using the server-specific certificates. We will briefly discuss enabling Secured Socket Layers (SSL), and how to incorporate the server-specific certificates into your SSL-enabled environment. We will continue our discussion on how to generate and add the server-specific certificate to each agent; and go into detail about what other fields need to be updated with the information included in the server-specific certificates. Topic(s) discussed: CONTROL M
