

# Setting parameter value retroactively

---

When I set a parameter value via `set("value",999)`, it is always associated with the current time of day. I would like to insert a value associated with a prior time so it will be included in the parameter history. For example, if a new value is calculated at 1:01 p.m., but the value actually represents the data as of 1:00 p.m., I want to enter the new value, with an effective time of 1 p.m.. Is there any way to specify a time along with the new value?

seems something got interpreted as an HTML tag in the last message...just for clarity, the syntax is `set("/APPL/INST/PARM/value",<'value'>,<'timestamp'>);`-- Geert
