

Filters in Component Version Map Reports

We use a specific component (BUILD) that stores the application version for deployment to various environments. When I use below report to find out the baseline version deployed, only the BUILD Component is useful but I don't see any ways to filter a specific component to display the versions deployed in all environments.

[Component Versions Map by Application - BMC Release Process Management 4.6 - BMC Documentation](#)

This feature is available when comparing properties of each component. I would appreciate if you can considering enabling the filter feature for each component for component versions map.

[Properties Map by Environment or Application - BMC Release Process Management 4.6 - BMC Documentation](#)

Another useful feature would be to enable users to generate and email custom reports using the GUI instead writing ruby automatons to make REST calls, etc.
