

ADDM OS account authentication & authorisation controls

We have a mandate to implement user access controls across our estate, which would enable to us track which human users were logged on or attempted to log on to our ADDM appliances at the OS level, at any given time. It is assumed that users would log on to the appliances as themselves and then switch user to 'tideway' to perform any ADDM application related tasks.

Our desire would be to use a supported third party piece software, which has the capability to provide centralised user authentication & authorisation controls for OS level accounts.

I would assume that this is something that many customers would benefit from and are likely to have a need for.
