

Preserve yum logs from RHEL PA

As far as I can tell, the only way to currently capture yum logs from a RHEL PA is to enable debug and then collect them from the app server. Either that or monitor the STAGING_DIR and make a copy before the PA finishes and cleans up after itself.

Requesting an option for the logs to be left on the target after PA completion so that administrators can have easy access to them. Making them available only on the app server isn't helpful because, at least in our environment, users don't have access to the app servers.
