

ADDM associate enclosures (aka Blade Centers) to their attached servers (aka Blades / Blade Servers).

Currently in ADDM devices enclosures (aka Blade Centers) are displayed only as Network Device.

Create an TKU official where enclosures (aka Blade Centers) were treated as "Host Container" and the attached servers (aka Blades / Blade Servers) were members of the "Host Container".

The relationship between them is very important both for visualization of network topology, and by the dependence of impact.
