

Idea to make event source part of filter criteria

This is an idea to make the event source selection (an optional)part of the filter criteria in TSPS Events view custom filters.

When we build custom filters they are typically built to filter events in a particular cell.

When using the filter we then have to first select the event source and then open the custom filter.

This idea is to make the event source part of the filter criteria so that when the custom filter is selected it automatically is effective on events from the correct event source.

This would make it one less step to view the desired events.

Currently a user has t:

- Open events view
- Select correct event source
- Open desired filter
- Apply desired table view
