

Add custom script to run before the verification step in provisioning jobs

I'd like to be able to add a script to a provisioning template (database, cluster, home) that will run before the Bda verification check step

- if the script exits with a non-zero return code the job fails.

- the script can have checks to validate the environment or make changes before the verification step is run preventing verification check failures and/or prevent failures in the provisioning step where the user then has to run a remove job to clean up the failed provisioning job.
