Editing Custom Views

Whilst editing a page within TSPS for a Summary Table, you are able to add and remove the required metrics easily.

However, if you wanted to add a metric and present it earlier on in the table and have only just added it, you can't move the metric to where you want it to be in the table.

E.g. If I had some metrics at the start and then wanted to rearrange them, to present them halfway through the table instead;

I would need to delete all the metrics and then re-add them in the right order, rather than just simply moving them to the right spot. This becomes increasingly annoying the more metrics you have. See below example:

The screenshot shows the 'Title' field set to 'Hosts available capacity'. Below it, there are 12 columns, each with an 'Edit parameters' link and a dropdown menu. The columns are:

Column	Metric
Column 1	Host (entname)
Column 2	Cluster (clustname)
Column 3	CPU Util Optimized [%] (cpu_)
Column 4	Memory Consumed [GB] (me)
Column 5	Memory Active [GB] (mem_a)
Column 6	Memory Ballooning [GB] (me)
Column 7	Memory Shared [GB] (mem_)
Column 8	Memory Swap In Rate [KB/s]
Column 9	Memory Swap Out Rate [KB/]
Column 10	Disk I/O Rate [MB/s] (disk_tra)
Column 11	Datastores Misconfigured (di)
Column 12	Real memory (total_real_mer)

The ideal situation here would be for me to move column 12 (Real Memory) to Column 4, moving everything along by 1 column, rather than having to delete columns 4-12 and re-add them again just to move a single metric.
