

Ability to check consolidator patterns against discovery patterns

In ADDM 10 the visual complexity of the Knowledge Management GUI is greatly increased. This complexity makes it quite difficult to easily work out whether the 'Consolidation' patterns are the same as the 'Discovery' patterns. There needs to be some kind of a test that is either automatic or manual that the active 'Consolidation' patterns are the same as the active 'Discovery' patterns. Having different patterns can affect discovery in ways that are not easy to see unless you go looking for them.
