Color coding Incident Console for SLM targets

- Log in to Developer Studio

- Open HPD:Incident Management Console form

- Double click on the table; go to the attributes; find the Color/results color attribute and open it up
➤ In selection field, choose SLM Status

➤ For each status, choose the color you want. (I don’t recommend setting the background to a color; just the “color” column which is the text.)
And when you flush or sync the midtier cache – next time in Incident Console – you’ll see colors!
